

Complete Summary

TITLE

Adolescent immunization status: percentage of adolescents who had a second dose of MMR and three hepatitis B vaccinations by their 13th birthday (Combination #1).

SOURCE(S)

National Committee for Quality Assurance (NCQA). HEDIS 2004. Health plan employer data & information set. Vol. 2, Technical specifications. Washington (DC): National Committee for Quality Assurance (NCQA); 2003. 374 p.

Brief Abstract

DESCRIPTION

For Adolescent Immunization Status, two separate combination rates are calculated. This measure (Combination #1) assesses the percentage of enrolled adolescents who turned 13 years old during the measurement year, who were continuously enrolled for twelve months immediately preceding their 13th birthday and who had had a second dose of MMR (measles-mumps-rubella) and three hepatitis B vaccinations by the member's 13th birthday. See the related measure, [Adolescent immunization status: percentage of adolescents who had a second dose of MMR, three hepatitis B and one chicken pox vaccination by their 13th birthday \(Combination #2\)](#).

RATIONALE

Generally, immunization programs have not focused on improving vaccination coverage among adolescents. There is consensus among advisory groups regarding the importance and timing of immunizations affecting the adolescent population. The Advisory Committee on Immunization Practices (ACIP) adopted recommendations for adolescent immunization which include routine immunization of adolescents not previously vaccinated with hepatitis B and the second dose of MMR (measles-mumps-rubella), giving an early booster dose of tetanus and diphtheria toxoids, and provision of other vaccines when indicated. For example, the ACIP recommendations are consistent with those of the American Academy of Pediatrics, the American Medical Association, the National Medical Association and the American Academy of Family Physicians.

PRIMARY CLINICAL COMPONENT

Immunization; measles; mumps; rubella; hepatitis B

DENOMINATOR DESCRIPTION

Adolescents who turned thirteen years old during the measurement year and who were continuously enrolled for 12 months immediately preceding their 13th birthday with no more than one gap in enrollment of up to 45 days during the continuous enrollment period

NUMERATOR DESCRIPTION

The number of adolescents from the denominator who had had a second dose of MMR (measles-mumps-rubella) and three hepatitis B vaccinations by the member's 13th birthday (Combination #1). See the related "Numerator Inclusions/Exclusions" field in the Complete Summary.

Evidence Supporting the Measure

PRIMARY MEASURE DOMAIN

Process

SECONDARY MEASURE DOMAIN

Not applicable

EVIDENCE SUPPORTING THE MEASURE

A clinical practice guideline or other peer-reviewed synthesis of the clinical evidence

A formal consensus procedure involving experts in relevant clinical, methodological, and organizational sciences

One or more research studies published in a National Library of Medicine (NLM) indexed, peer-reviewed journal

Evidence Supporting Need for the Measure

NEED FOR THE MEASURE

Use of this measure to improve performance

EVIDENCE SUPPORTING NEED FOR THE MEASURE

BURDEN OF ILLNESS

Currently there are about 1.25 million people who have life-long hepatitis B virus infection. Each year about 4,000-5,000 of these people die from related liver disease resulting in over \$700 million of medical and work-loss costs. Approximately 25% of children who become infected with life-long hepatitis B virus would be expected to die of related liver disease as adults. If vaccination for chicken pox were to stop, the disease would quickly return to its previous high rate of infection, and every child would miss a week of school, every parent a week of work, and 50-100 varicella-related deaths would occur each year, most of them in previously healthy children and adults.

The expected measles morbidity among a birth cohort of 4.1 million without vaccination against measles would be 3.7 million cases, over 350,000 complications, and 1,859 deaths, with total direct and indirect costs of \$2.2 billion and \$1.6 billion, respectively.

UTILIZATION

Unspecified

COSTS

Vaccine-preventable diseases have a costly impact, resulting in doctor's visits, hospitalizations, and premature deaths. Sick children can also cause parents to lose time from work. Currently there are about 1.25 million people who have life-long hepatitis B virus infection. Each year about 4,000-5,000 of these people die from related liver disease, resulting in over \$700 million of medical and work-loss costs. In 1990 in the U.S., the cost of caring for children who contracted chicken pox was estimated as \$918 million annually.

EVIDENCE FOR COSTS

Data Collection for the Measure

CASE FINDING

Both users and nonusers of care

DESCRIPTION OF CASE FINDING

Enrolled adolescents who turned thirteen years old during the measurement year and who were continuously enrolled for 12 months immediately preceding their 13th birthday with no more than one gap in enrollment of up to 45 days during the continuous enrollment period

DENOMINATOR SAMPLING FRAME

Enrollees or beneficiaries

DENOMINATOR (INDEX) EVENT

Patient Characteristic

DENOMINATOR INCLUSIONS/EXCLUSIONS

Inclusions

Adolescents who turned thirteen years old during the measurement year and who were continuously enrolled for 12 months immediately preceding their 13th birthday with no more than one gap in enrollment of up to 45 days during the continuous enrollment period

Exclusions

Adolescents who had a contraindication for a specific vaccine may be excluded from the denominator.

NUMERATOR INCLUSIONS/EXCLUSIONS

Inclusions

For all antigens, managed care organizations (MCOs) may count evidence any of the following:

- evidence of the antigen or
- documented history of the illness or
- a seropositive test result.

For combination vaccinations that require more than one antigen (i.e., MMR), MCOs must find evidence of all three antigens.

MMR: A second dose of MMR by the member's 13th birthday. A member is considered compliant if they have received either:

- one MMR on or between the member's 4th and 13th birthdays or
- two MMRs on or between the member's 1st and 4th birthdays.

Hepatitis B: Three hepatitis B with with different dates of service on or before the member's 13th birthday. MCOs may count a member compliant if the member received the complete two-dose hepatitis B regimen defined by Current Procedure Terminology (CPT) code 90743. Members are also compliant if they have received one dose of the two-dose regimen (90743) and two other doses of hepatitis B.
