Brief Abstract

Description
This measure is used to assess the percentage of home health episodes of care during which the patient’s toileting hygiene improves.

Rationale
Patients need certain physical abilities and capacities (motor skills, symptom relief) to manage toilet hygiene. Many patients who receive home health care are recovering from an injury or illness and may have difficulty performing the tasks necessary for toileting hygiene and/or may need help from another person or special equipment to accomplish this activity. Good toileting hygiene can reduce the risk of urinary tract infections (UTIs) and other infections related to inadequate hygiene. Improving toileting hygiene reduces the risk of preventable health-care associated infections. High-quality home health care will reinforce toileting hygiene and protect patients against the development of a UTI during care. Improvement in toileting hygiene is an indicator of effective high-value care.

A report on agency performance on this measure is provided to home health agencies (HHAs) as part of the Outcome-Based Quality Improvement (OBQI) Outcome Report. The OBQI reports allow the agency to compare their agency's rates in the current year compared to prior years and to rational reference rates (i.e., benchmarking) values. HHAs can use the OBQI outcome measures as part of a systematic approach to continuously improving the quality of care they provide by targeting care practices that influence specific patient functioning and health status. Therefore, the measure is important to making significant gains in health care quality and improving health outcomes for a specific high
Evidence for Rationale

Primary Health Components

Home health care; activities of daily living (ADLs); toileting hygiene

Denominator Description

Number of home health episodes of care ending with a discharge during the reporting period, other than those covered by generic or measure-specific exclusions (see the related "Denominator Inclusions/Exclusions" field)

Numerator Description

Number of home health episodes of care where the value recorded on the discharge assessment indicates less impairment in toileting hygiene at discharge than at start (or resumption) of care (see the related "Numerator Inclusions/Exclusions" field)

Evidence Supporting the Measure

Type of Evidence Supporting the Criterion of Quality for the Measure

A formal consensus procedure, involving experts in relevant clinical, methodological, public health and organizational sciences

One or more research studies published in a National Library of Medicine (NLM) indexed, peer-reviewed journal

Additional Information Supporting Need for the Measure

Unspecified

Evidence for Additional Information Supporting Need for the Measure

Extent of Measure Testing

Validity

As part of development of the measure, the following validity assessments were conducted:

1. Consensus validity by expert researcher/clinical panels for outcome measurement and risk factor measurement
2. Consensus validity by expert clinical panels for patient assessment and care planning

State of Use of the Measure
State of Use
Current routine use

Current Use
not defined yet

Application of the Measure in its Current Use

Measurement Setting
Home Care

Professionals Involved in Delivery of Health Services
not defined yet

Least Aggregated Level of Services Delivery Addressed
Single Health Care Delivery or Public Health Organizations

Statement of Acceptable Minimum Sample Size
Specified

Target Population Age
Age greater than or equal to 18 years

Target Population Gender
Either male or female

Data Collection for the Measure

Case Finding Period
- Rolling 12 month period

Denominator Sampling Frame
- Patients associated with provider

Denominator (Index) Event or Characteristic
- Encounter

Patient/Individual (Consumer) Characteristic

Denominator Time Window
- not defined yet

Denominator Inclusions/Exclusions

Inclusions
- Number of home health episodes of care ending with a discharge during the reporting period, other than those covered by generic or measure-specific exclusions

All home health episodes:
- With an OASIS assessment for both the beginning and end point
- With an end point that occurs in the reporting year
- Other than those covered by denominator exclusions

Exclusions
- Measure-specific Exclusions

Home health episodes of care for which:
1. At start/resumption of care OASIS item M1845 "Toileting Hygiene" = 0, indicating the patient had no impairment in toileting hygiene; OR
2. The value recorded of OASIS item 1700 "Cognitive Functioning" = 4, indicating that the patient was totally dependent due to disturbances
such as constant disorientation, coma, persistent vegetative state or delirium.
3. The value recorded on M1710 "When Confused" or M1720 "When Anxious" is Not Applicable (NA) on the start (or resumption) of care, indicating the patient is non-responsive; OR
4. The patient did not have a discharge assessment because the episode of care ended in transfer to inpatient facility or death at home; OR
5. All episodes covered by the generic exclusions

Generic Exclusions

Home health episodes of care that are exempt from the OASIS reporting requirement, including:
1. Pediatric home health patients
2. Home health patients receiving maternity care only
3. Home health clients receiving non-skilled care only
4. Home health patients for which neither Medicare nor Medicaid is a payment source

Exclusions/Exceptions

not defined yet

Numerator Inclusions/Exclusions

Inclusions
Number of home health episodes of care where the value recorded on the discharge assessment indicates less impairment in toileting hygiene at discharge than at start (or resumption) of care

Note: Improvement in Toileting Hygiene is coded as follows:

• 1 (YES) IF: The value recorded for the OASIS item M1845 on the discharge assessment is numerically less than the value recorded on the start (or resumption) of care assessment, indicating less impairment at discharge compared to start of care.
• 0 (NO) IF: The value recorded for the OASIS item M1845 on the discharge assessment is numerically greater than or equal to the value recorded on the start (or resumption) of care assessment, indicating the same or more impairment at discharge compared to start of care.

Desired value is a higher score

Allowance for Patient or Population Factors

not defined yet

Description of Allowance for Patient or Population Factors

Logistic regression models for risk adjustment were developed using three million episodes of care based on OASIS national repository data from assessments submitted between January 1, 2010 and September 30, 2010.

Standard of Comparison

not defined yet

Identifying Information

Original Title

Improvement in toileting hygiene.
